

UrbanCart Analytics — Executive Summary

UrbanCart's 3-year transaction history (9,000 orders, 2,500 customers, \$12.97M net revenue) was cleaned, reconciled with two messy legacy files, and analyzed to answer three questions: who our best customers are, which products are actually profitable, and whether our signup data can be trusted.

Top 5 Findings

- Revenue is concentrated: Books & Media (\$3.84M) and Beauty & Health (\$3.04M) drive nearly half of all revenue, on higher average order value rather than more orders.
- A small "Champions" customer segment (472 of 2,500 customers) generates the most lifetime revenue — older, established customers, not high-volume browsers.
- 3 products (IDs 300, 222, 105) are on track to stock out almost certainly within the next 14 days at current inventory levels.
- Data-quality fixes materially matter: correctly counting returns lowers reported revenue by 2.97% (~\$396K) versus a naive calculation — a large enough swing to change category rankings.
- Legacy signup data is salvageable: 1,345 of 1,428 legacy records are clean and usable after standardizing 4 different date formats and removing 80 duplicate records.

Recommendations

- Reorder products 300, 222, and 105 immediately (recommended ~22-24 units each).
- Build a win-back campaign for the 1,001 'At Risk' / 'Churned' customers before they fully lapse.
- Standardize date/name capture in future marketing exports to prevent repeat cleanup cost.
- Investigate why Electronics and Apparel lag on average order value despite similar order volume.

Full methodology, statistical detail, and all 8 supporting charts are in the accompanying 30-page report.docx.
